

powering fleets with simplicity

NEW

e-flow

e-flow is the hidden intelligence that transforms complexity into simplicity. It's a control unit that manages up to four charging plugs, bringing together all the advanced technologies of the blueberry family like dynamic power allocation and optional user authentication, metering and payment systems in a minimal, efficient form.

While it may not feature design screens as i-light or advertise as in the blueberry family, e-flow is the silent brain behind every charging session. It connects, controls, and streamlines charging interactions — intelligently managing the flow between the system and each vehicle it serves, when the installation relies solely on satellite units, such as in fleet applications.

e-flow complements our user-facing products like blueberry and i-light, but fills a distinctly different role: Making everything work from a much simpler unit.

e-flow

Whether deployed in public charging hubs, fleet depots, or private infrastructures, e-flow brings a new layer of behind-the-scenes intelligence to EV charging. It's small in form, simple in design, but mighty in function.

Key features

- Supports up to 4 charging outputs
- Dynamic power allocation across all active sessions
- Acts as the control hub for multi-port charging installations
- Touch display
- Optional user authentication
- Optional payment system integration
- Optional certified metering
- Communication with OCPP backend systems
- Communication with my.i-charging for maintenance
- Seamlessly integrated into the i-charging ecosystem

Powering simplicity, **enabling energy flow.**
